# Context Structure Management

## Defining Context Structure

In the Workflow perspective, the context structure describes how data is stored in memory during execution.

The context structure comprises folders and items:

- A folder can contain items and other folders.
- Each folder or item can be considered as an array

## Context Structure Management

The video below describes:

- How to automatically generate the context structure:
  - Folders / items are auto-generated when Get / Set actions are used
  - Auto-generation can be disabled in workflow settings
- How to manually update the context structure
- How to link an activity to its context parameter
